I use @Temporal for

convenience in creating a Joda LocalDateTime.

Question : For a class that uses an @Temporal annotated field, I also have to annotate it with @Temporal(TemporalType.TIMESTAMP). This is not convenient as it causes the setter to have to be annotated with @TemporalType(TemporalType.TIMESTAMP) and @Temporal(TemporalType.DATE). The reason I need to do this is because I'm implementing a NoSQL DB

which doesn't support DATE. Problem: If the user is not supplied with a value then a NullPointerException is thrown. What is the best way to support this case? I haven't tried this yet, but if I don't supply a default value, I can use something like

```
public class Test {  
    @Override public void  
    setSomething(Something  
        other) {  
        other.getSomething(); } }  
and everything is happy. Is  
this the correct strategy? A:
```

Have you tried throwing a
IllegalStateException?

```
public class Test {  
    @Override public void  
    setSomething(Something  
other) { if (other == null) {  
        throw new  
IllegalStateException("other  
is null"); }  
other.getSomething(); } }
```

Wednesday, October 31, 2012 I've recently been converted from a Mac to a Linux (Ubuntu 12.04) computer and I enjoy using it quite a lot. I've already built a few Linux distributions (Arch, Mint, and Debian) with Linux Mint being my favorite for use at home. This is primarily because it's a complete package. However, the biggest drawback of Linux is the lack of Windows compatibility. Currently, I have no way of sharing files, folders, programs, games, etc., with my family on Windows computers. In fact, I even have a hard time playing Windows games using Wine. The other night I was so frustrated trying to import stuff

that I just gave up on Linux entirely. It reminded me of when I was a kid and I hated computers because they weren't smart enough to do what I wanted them to do. I used to write code to get around the limitations of Windows and other operating systems. It was fun to watch them get angry at me when I changed their settings without their consent. After using Linux for a while, I've discovered that there are a number of web services that are useful for just about anything you could want from an online service, including file sharing. The problem is that everything works differently. Finding the right program, website, or service requires a LOT of research and time. I thought that as my interest grows and as I continue to learn more about this hobby, I would share some of my

Edited by (editor).Q: C#: Is there any difference between [Serializable()] and [field: NonSerialized] By definition, it looks like both [Serializable] and [field: NonSerialized] produce the same result. But which one is better? (I was thinking if there is any performance difference.) A: These techniques are not used during deserialization of fields. The two techniques will be used for

serialization of fields. But there is a significant difference between the two in that [field: NonSerialized] will emit a copy of the field's backing field onto the serialized form. This can be significant performance wise. [field: NonSerialized] is useful for fields that are only present on the class or it's members. This is useful for a scenario where you want to be able to serialize and deserialize the Field on its own, but you don't want to copy the field when serializing. For fields that are deeply embedded within classes that serialize, there is nothing practical that can be done. Emitting large classes or large numbers of fields is expensive and may not be practical. Q: Can the BSER register be shared in SM? Given that the BSER is a read only register, can this register be shared by either the processor and the memory or only by
